Compiling LibRoadRunner for CC3D on Linux (tested on Ubuntu distributions)

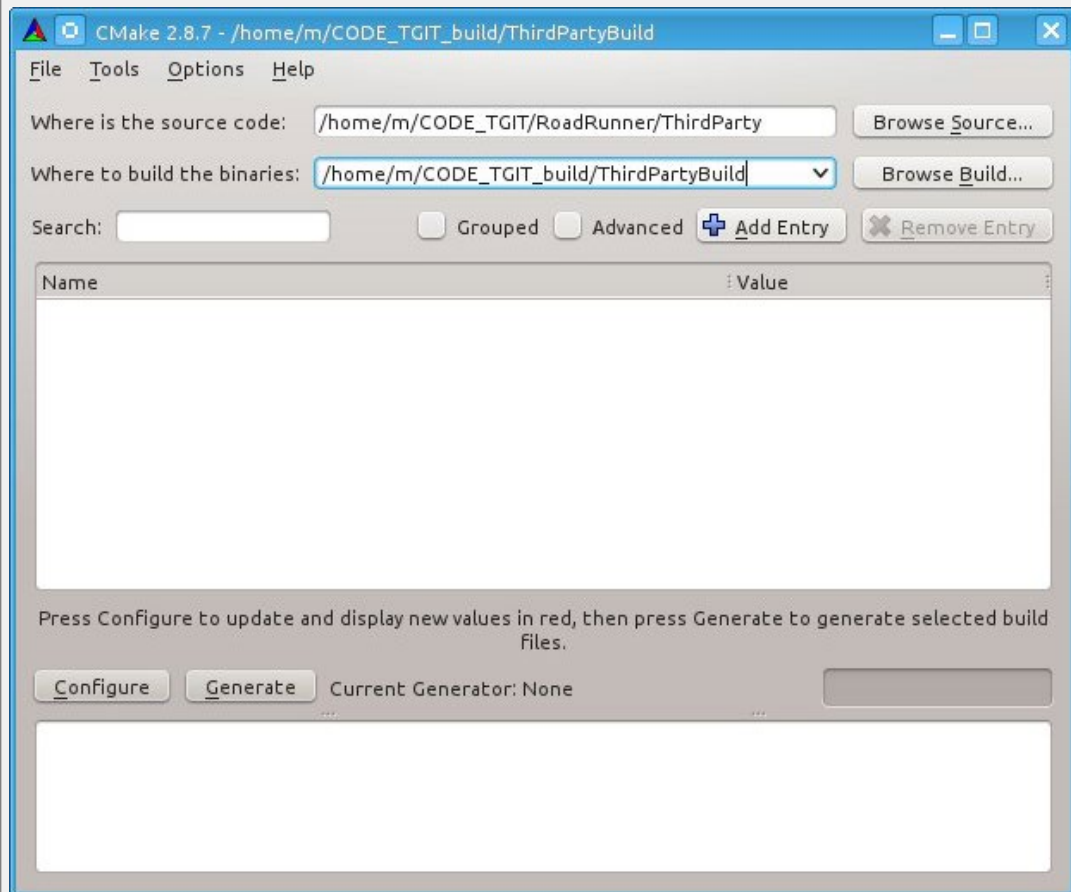

CC3D git repository contains a copy of a [RoadRunner](#) Library which has been customized to work with CC3D. You can find it in <CC3D_Git_root>/RoadRunner. In my case the location is /home/m/CODE_TGIT/RoadRunner.

The compilation of [RoadRunner](#) is a two step process. First we build [ThirdParty](#) libraries located in /home/m/CODE_TGIT/RoadRunner/ThirdParty folder and then we build actual [RoadRunner](#) library located in /home/m/CODE_TGIT/RoadRunner.

Building ThirdParty libraries:

Cmake Configuration and Makefile generation

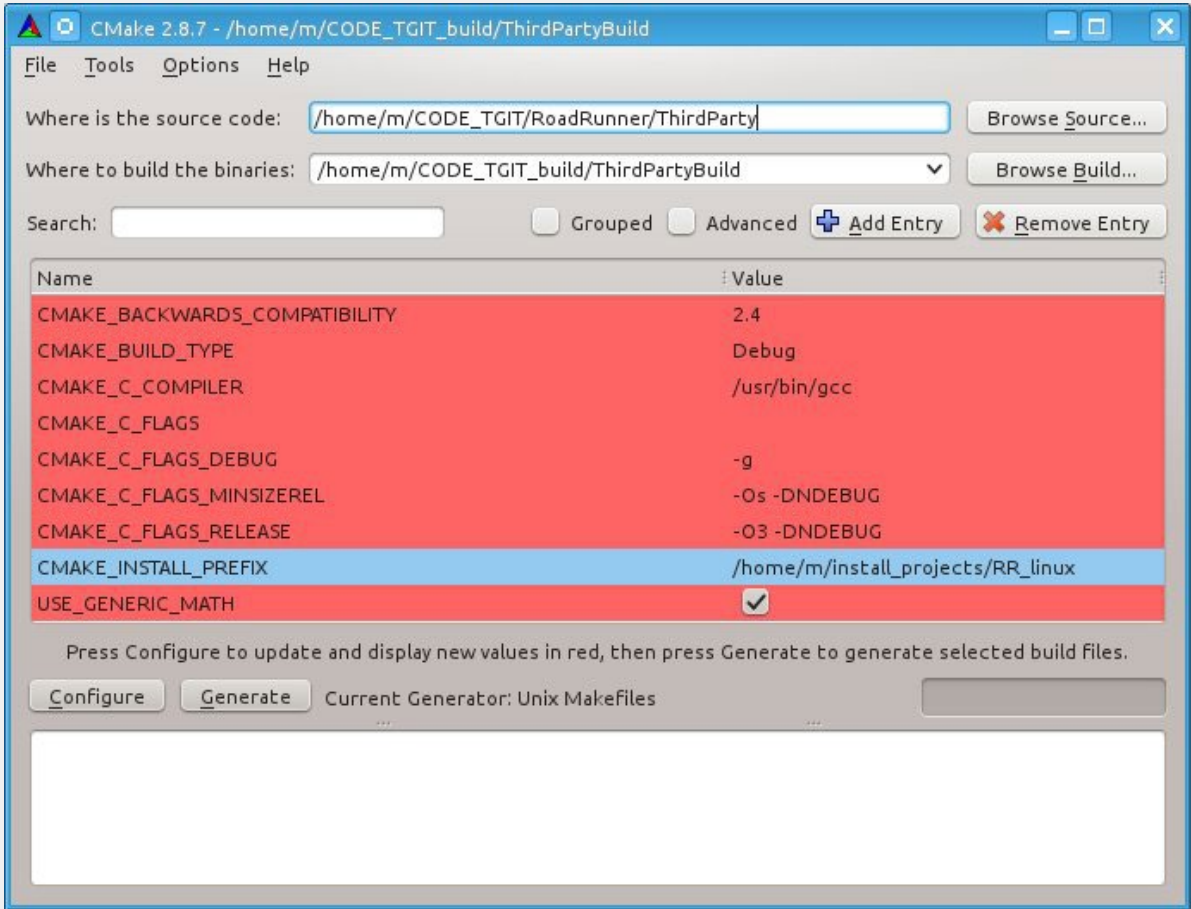

Open Cmake and point it to source (/home/m/CODE_TGIT/RoadRunner/ThirdParty) and build (/home/m/CODE_TGIT_build/ThirdPartyBuild) directories:

Click configure button at the bottom and Unix Makefiles from pull down menu in the dialog box that pops up, click Finish:

After Cmake finishes initial configuration you should get the following screen:

Notice, I have changed CMAKE_INSTALL_PREFIX to point to /home/m/install_projects/RR_linux. It is a good idea to change it in your Cmake configuration as well to a directory where you will install [RoadRunner](#).

Be careful here: Next thing we will do is to change build CMAKE_BUILD_TYPE variable from Debug to Release:

IMPORTANT:

You need to determine what type of linux installation you are dealing with because configuration options will depend on it. To check linux distribution simply type:

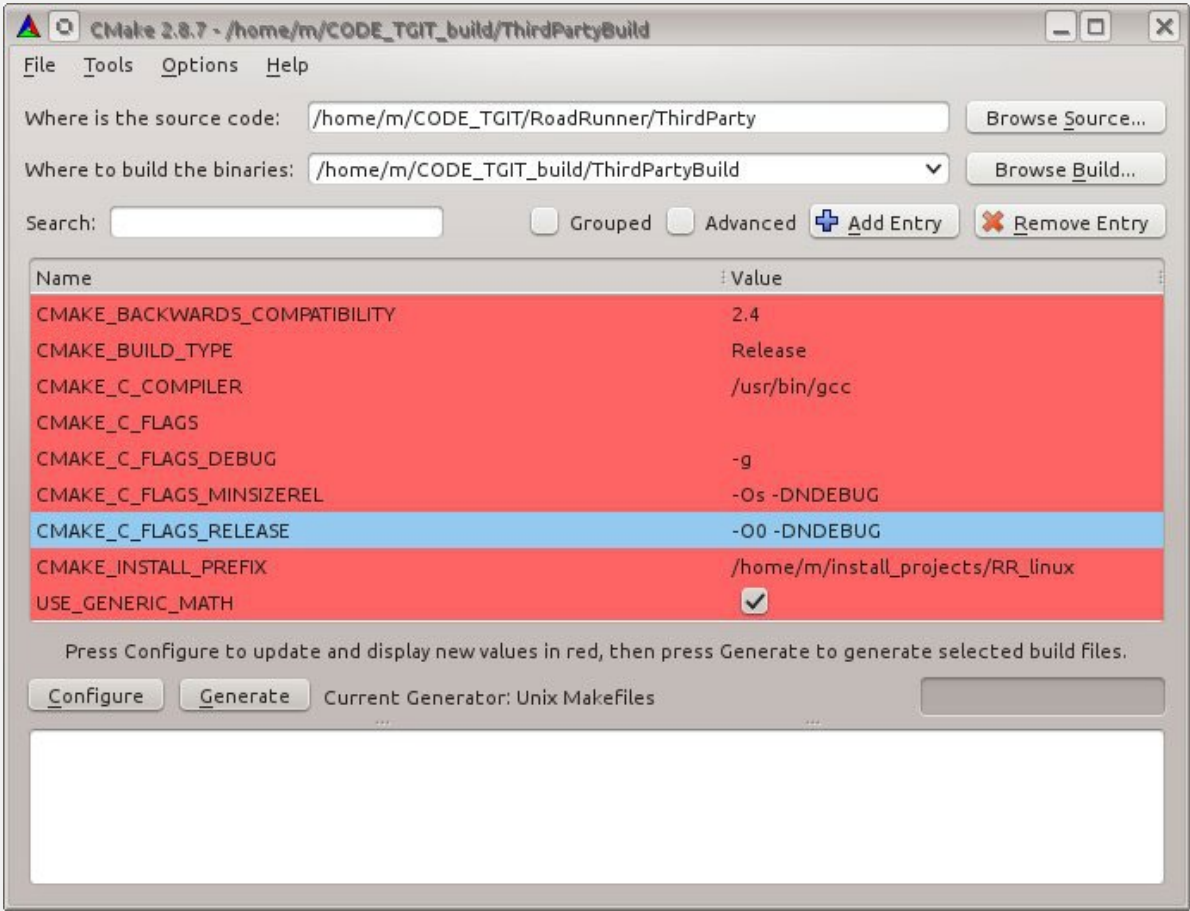

```
cat /etc/*-release
```

in my case I get

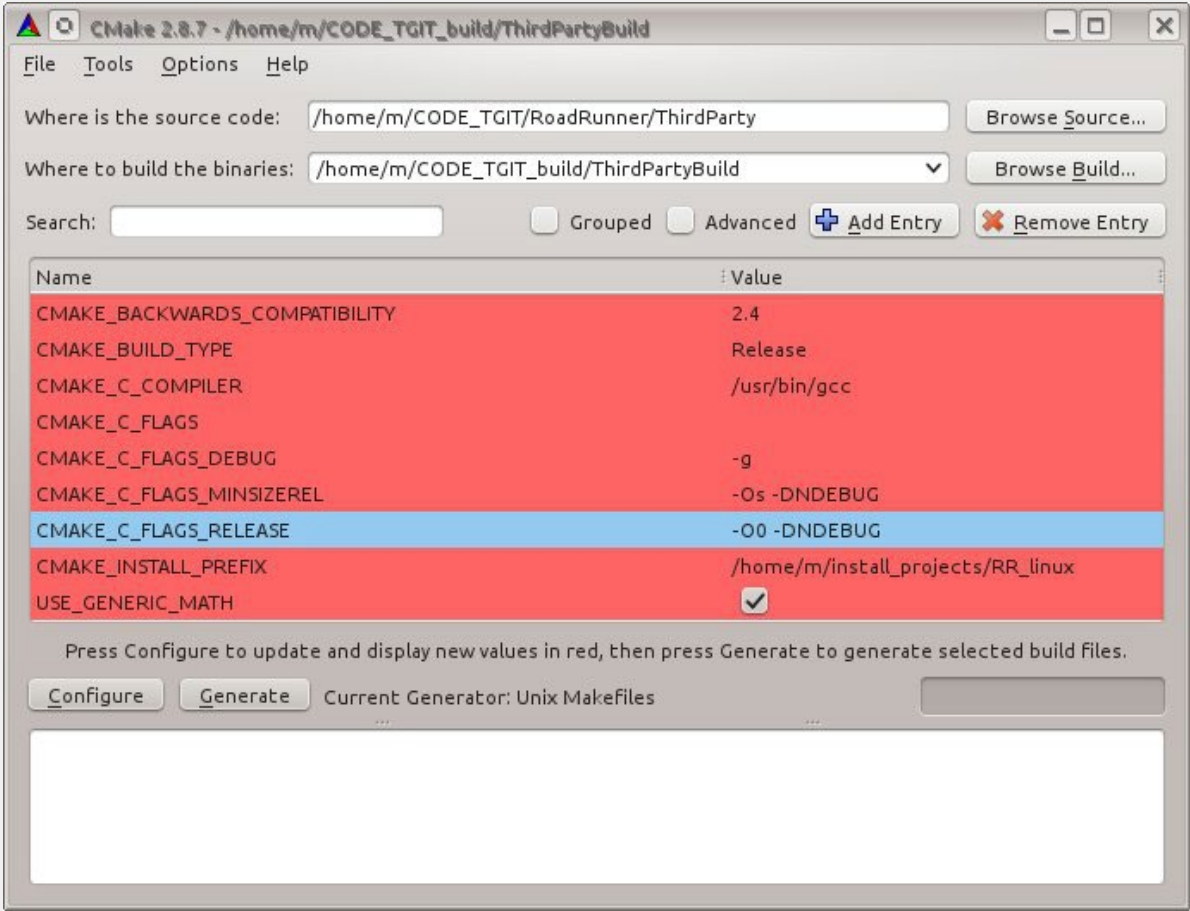

```
DISTRIB_ID=Ubuntu
DISTRIB_RELEASE=12.04
DISTRIB_CODENAME=precise
DISTRIB_DESCRIPTION="Ubuntu 12.04.2 LTS"
NAME="Ubuntu"
VERSION="12.04.2 LTS, Precise Pangolin"
ID=ubuntu
ID_LIKE=debian
PRETTY_NAME="Ubuntu precise (12.04.2 LTS)"
VERSION_ID="12.04"
```

which tells me that I am on 32 bit machine (I don't see anywhere in the above printout phrases like x86_64 or 64 bit)

If you are on 64 bit linux all you need to do is to change Debug To Release as shown in figure below

If you are on 32 bit linux installation you have to decrease optimization of the C code by changing CMAKE_C_FLAGS_RELEASE to -O0 -DNDEBUG as shown below:

After clicking Configure and then Generate you will generate Makefiles project for [ThirdParty](#) libraries.

Compilation of ThirdParty project using command line tools:

Open terminal on linux and go to the directory where the Makefiles are generated - in my case they are in `/home/m/CODE_TGIT_build/ThirdPartyBuild` so I type

```
cd /home/m/CODE_TGIT_build/ThirdPartyBuild
```

To start compilation I type

```
make
```

After compilation is finished and there are no errors
I type

```
make install
```

```

[ 99%] Building CXX object poco/XML/src/CMakeFiles/poco_xml-static.dir/Node.cpp.o

[ 99%] Building CXX object poco/XML/src/CMakeFiles/poco_xml-static.dir/xmlparse.cpp.o
[ 99%] Building C object poco/XML/src/CMakeFiles/poco_xml-static.dir/xmlrole.c.o
[100%] Building C object poco/XML/src/CMakeFiles/poco_xml-static.dir/xmltok.c.o
Linking CXX static library ../../lib/libpoco_xml-static.a
[100%] Built target poco_xml-static
m@m-lap:~/CODE_TGIT_build/ThirdPartyBuild$ make install

```

and this installs [ThirdParty](#) libraries to `/home/m/install_projects/RR_linux`

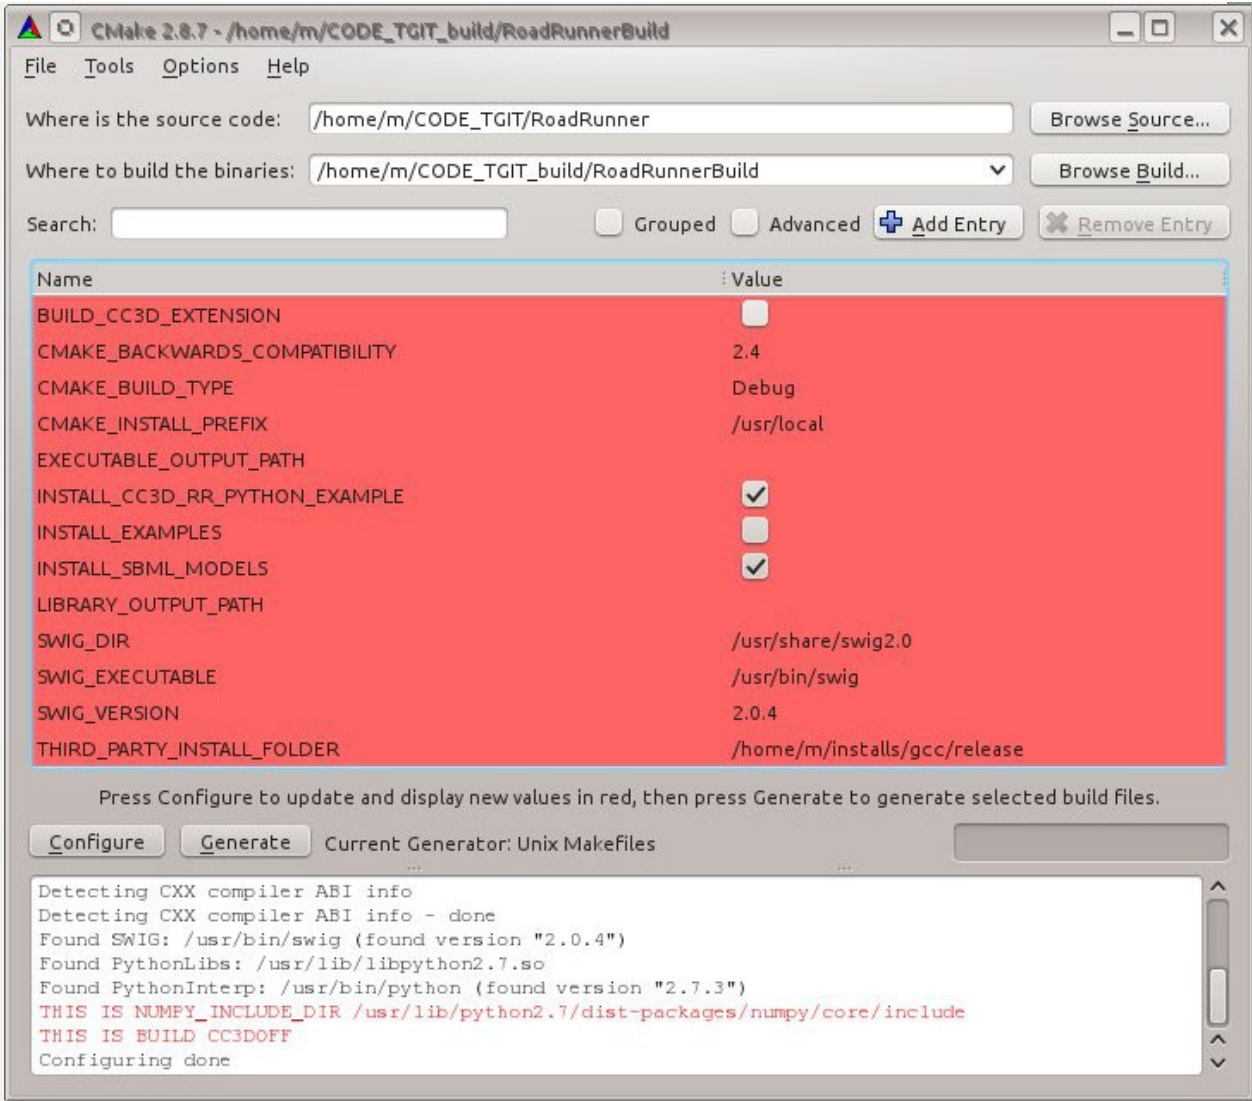

Building RoadRunner for CC3D on linux (tested on Ubuntu systems)

Cmake Configuration and Makefile generation

Open Cmake and point it to source (`/home/m/CODE_TGIT/RoadRunner`) and build (`/home/m/CODE_TGIT_build/RoadRunnerBuild`) directories:

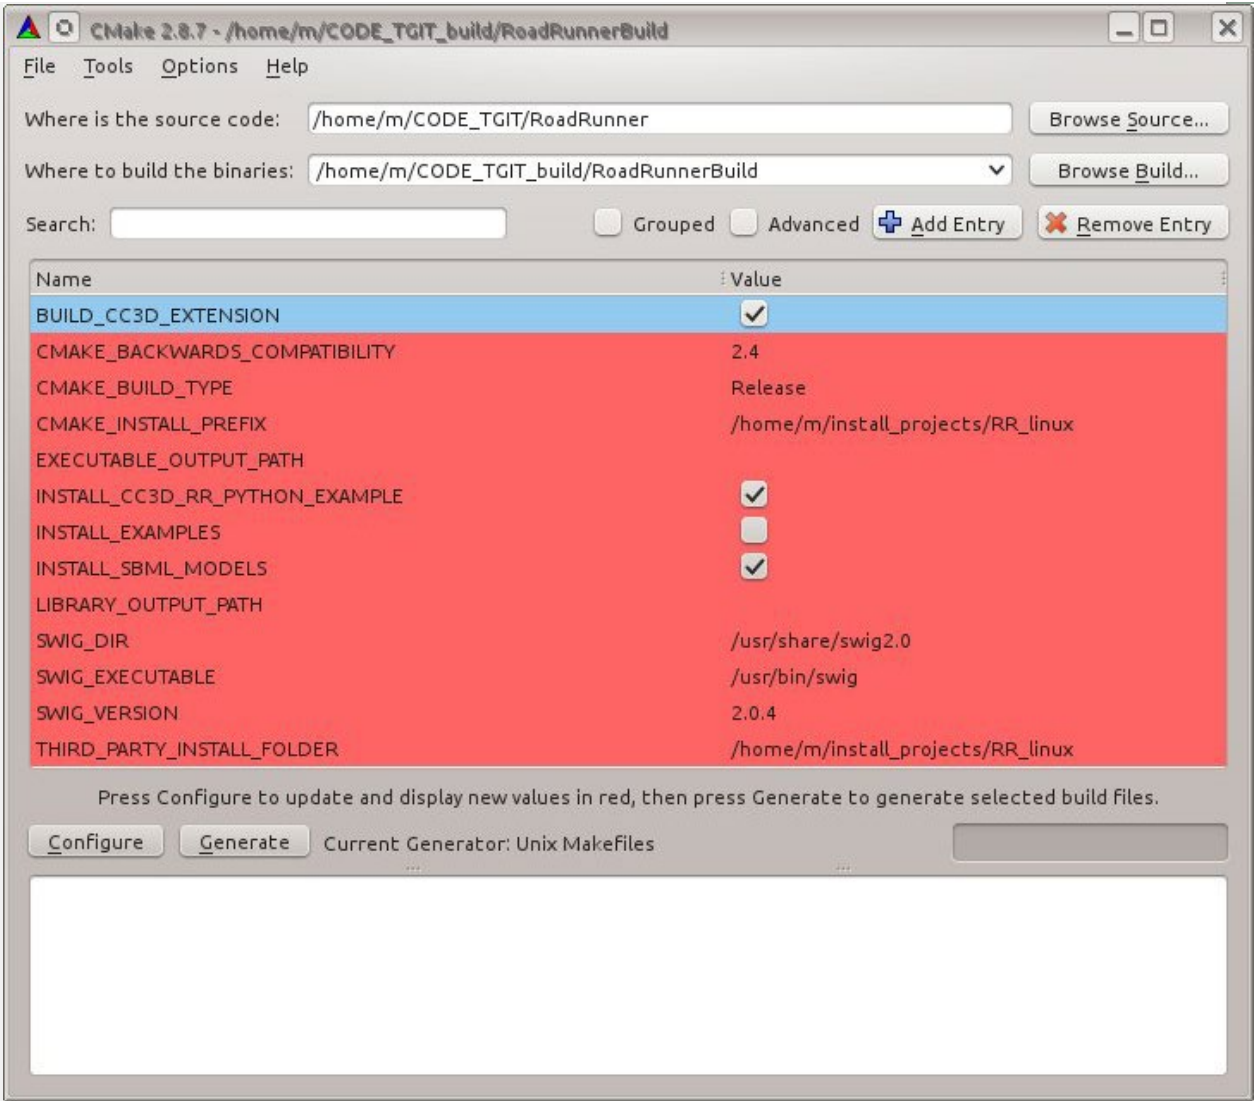

Click configure button at the bottom and Choose Unix Makefiles from pull down menu in the dialog box that pops up, click Finish. You should get the following screen

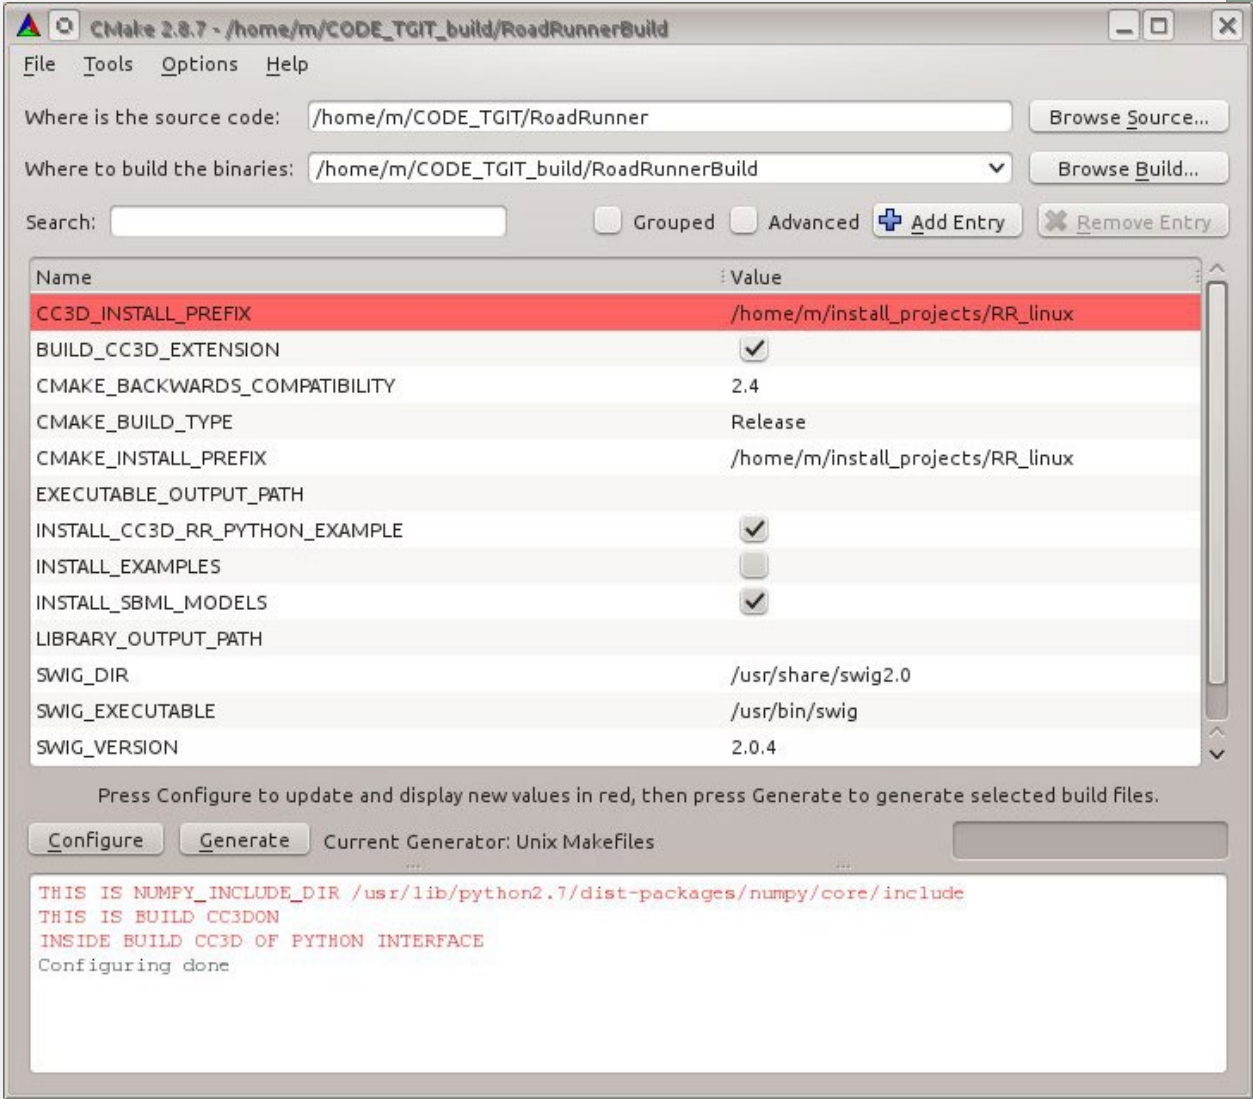

Here we have to change few things:

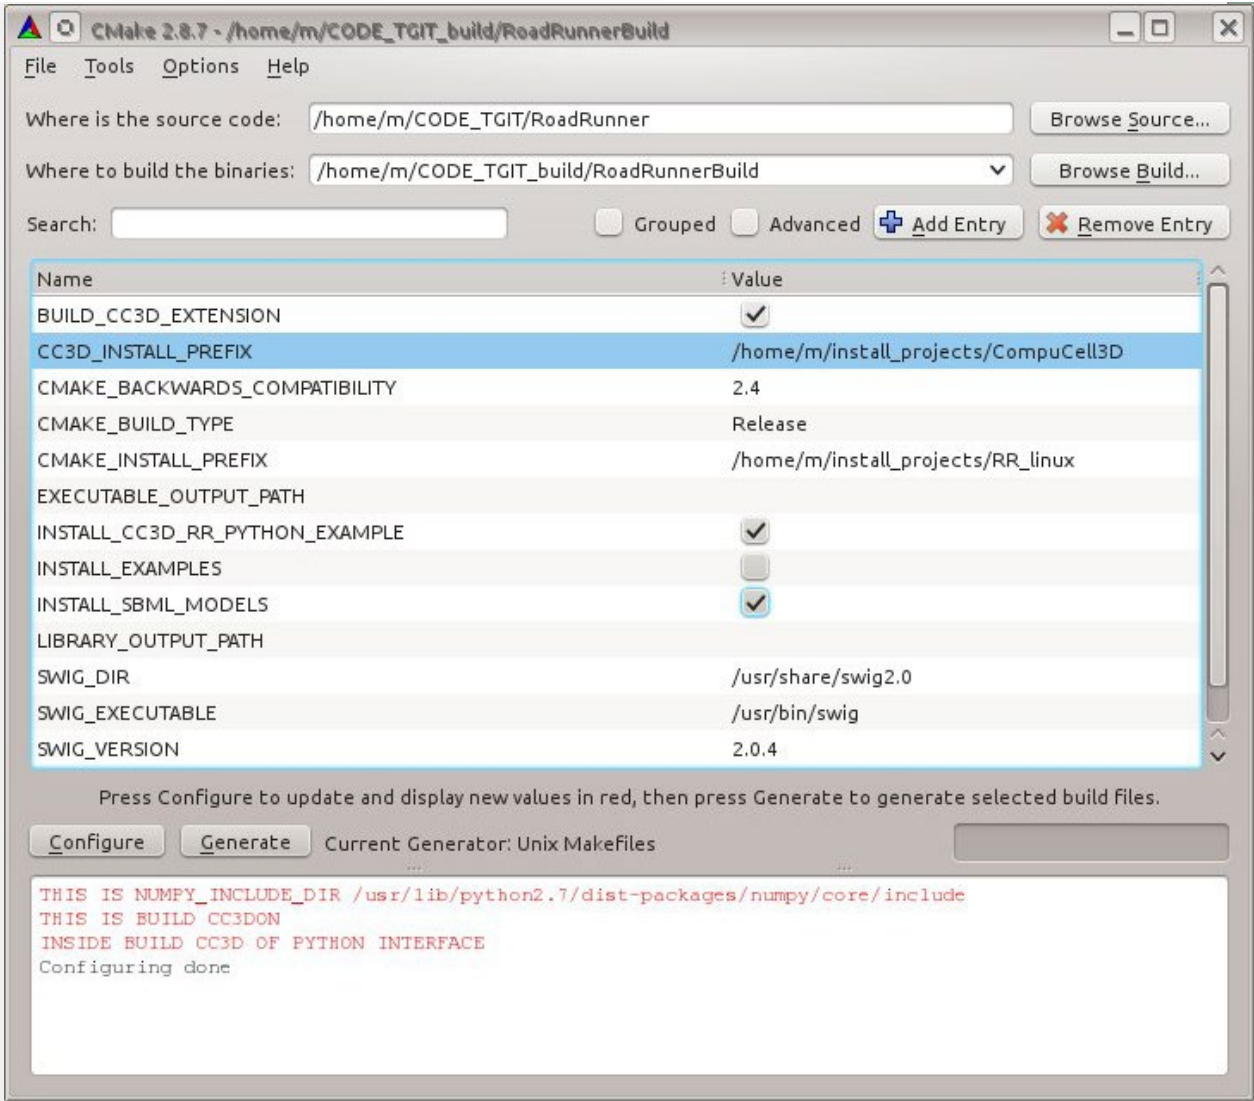

- THIRD_PARTY_INSTALL_FOLDER gets changed to `/home/m/install_projects/RR_linux` - remember , this is where [ThirdParty](#) Libraries were installed
- CMAKE_INSTALL_PREFIX gets changed to `/home/m/install_projects/RR_linux` - we will be installing core [RoadRunnerLibrary](#) there
- CMAKE_BUILD_TYPE gets changed to `Release`
- Click BUILD_CC3D_EXTENSION option at the top

Then click Configure and you should get the following screen:

Here we will change CC3D_INSTALL_PREFIX (see the top option in the above screenshot) to /home/m/install_projects/CompuCell3D (I am assuming your base CC3D is in this directory)

Compilation of RoadRunner project:

This is identical to the compilation of [ThirdParty](#) libraries:

- 1) Open terminal and go to `/home/m/CODE_TGIT_build/RoadRunnerBuild`

```
cd /home/m/CODE_TGIT_build/RoadRunnerBuild
```

- 2) type

```
make
```

to start compilation

- 3) type

```
make install
```

to install [RoadRunner](#)

Now your CC3D installtion should have [RoadRunner](#) installed and all SBMLSolver based simulations should run
